Chandler Nauta

Defects in AI output

1. Is the case of multiple people joining a group multiple times because it would allow both to join but it would overwrite the list and it would not show one of the new joined peoples name on the list which also allows users to bypass the 10 user limit. I found this out because I asked what would happen in that case. So i had to develop a race condition where it would store the requests to join and then do them in order that way the condition would not happen.
2. The slices did not cover the ability for the host to remove items from peoples orders. The claude sonnet was unsure and not really clear on what I was thinking for all the requirements for that requirement. I found this through inspecting the sight after it finished the front end of it. I noted some experiences I would like to see as a user of the site and tried my best to think of every single case in action that could happen like someone joining the group on accident. So I added a remove button only the host can see and use.
3. When checking out it did give a pop or anything as well as the alerts were lacking in style and felt like low quality had to give it another prompt to show pop up windows and allow it to store the break downs for each users costs and show it whenever a checkout was successful.

2. Where the AI helped the most and least, the tests and building the backend structure it helped out tremendously felt it did excel when i had small requests. It lack in the CS even now im not too satisfied with its creativity for the front end, it looks very barbone and weak.

3. It stayed relatively the same I made the prompts beforehand and had AI help sharpen it.

4. Left over coin was going to be given to the host, but I did change it. But for some redesigns so each person can see their order cost was thanks to AI decision. Overall as the prompts progress I looked over the prompts more and more and had more input for each as a got a better idea of the project.

5. There are no automated browser tests, no deep malicious tests can be tried, we have only a fake clock for expire, we do not see the case where I have an order opened

before the store closes but then try to place ti after it closes within the 2 hour expiry. I still need to work on the front end.
